Business Analysis Case Study: Doi Tung Training Plan & Record Application System

1. Project Overview

The Training Plan Management System is a business analysis case study designed to address inefficiencies in manual training management processes, where training schedules, participant tracking, and progress monitoring were handled using spreadsheets and informal communication.

The existing approach led to challenges such as poor visibility of training schedules, difficulty in managing participant information, and lack of centralized tracking of training progress.

The proposed solution is a web-based system that enables administrators to create and manage training plans, assign participants, and track training schedules efficiently. The system aims to improve organization, accessibility, and operational efficiency.

Stakeholders

1. Training Administrators
2. Participants / Employees
3. Organization Management/Manager

Project Goals

- Centralize training management
- Improve visibility of training schedules
- Simplify participant tracking
- Reduce manual administrative work
- Improve training planning efficiency

My Role

Business Analyst | Frontend Developer

Responsibilities:

• Requirement Gathering & Analysis
• User Story Creation
• Process Modeling (AS-IS / TO-BE)
• Risk Assessment
• Stakeholder Analysis
• Wireframe Documentation

Tools Used

• Figma
• Draw.io
• Google Docs / Microsoft Word
• Jira (Backlog & User Story Management)

2. Business Problem Analysis

Problem	Impact
Lack of centralized system for training plans	Reduced productivity of administrators
Difficulty tracking participant enrollment	Poor training coordination
No real-time visibility	Missed or overlapping training sessions
Manual updates leading to human errors	Difficulty in evaluating training effectiveness
Inefficient communication between trainers and participants	Increased administrative workload

3. Requirement Summary

Functional Requirements

- Create and manage training plans
- Assign participants to training sessions
- View training schedules
- Track participant enrollment

- Update training status
- Generate training reports

Non-Functional Requirements

- System security and user authentication
- High availability and reliability
- User-friendly interface
- Fast response time
- Scalable architecture

4. User Stories

Employee User Stories

US-01: View Training Sessions
As a participant, I want to view my assigned training sessions so that I can prepare accordingly.

US-02: Submit Training Certificates
As a participant, I want to submit all completed certificates so that I can submit my certificates as proof of completion.

Admin User Stories

US-03: Manage Training Plans
As an administrator, I want to manage training plans so that all training activities are organized.

US-04: Assign Tasks
As an administrator, I want to assign participants to training programs so that enrollment is properly managed.

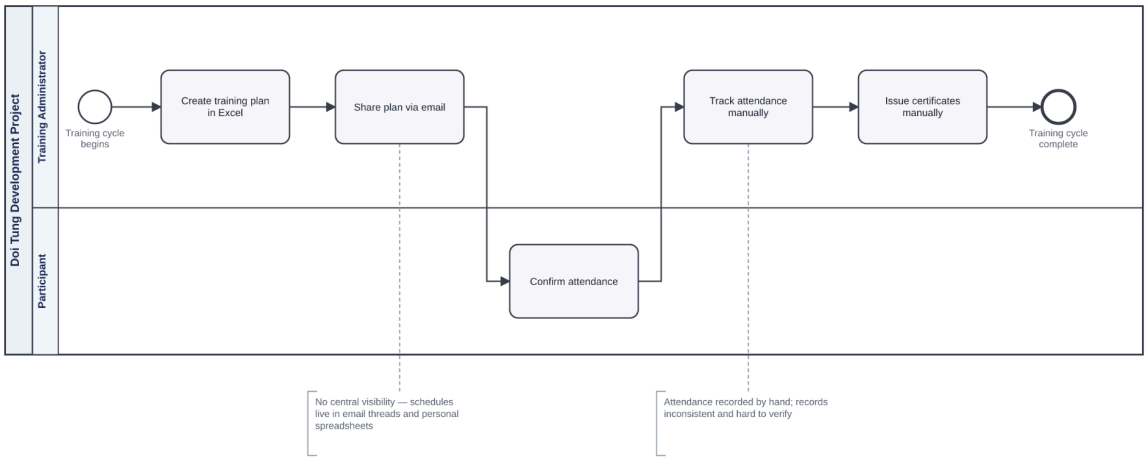

Manager User Stories

US-05: Register Staff to Training
As a department manager, I want to register the participants under my department.

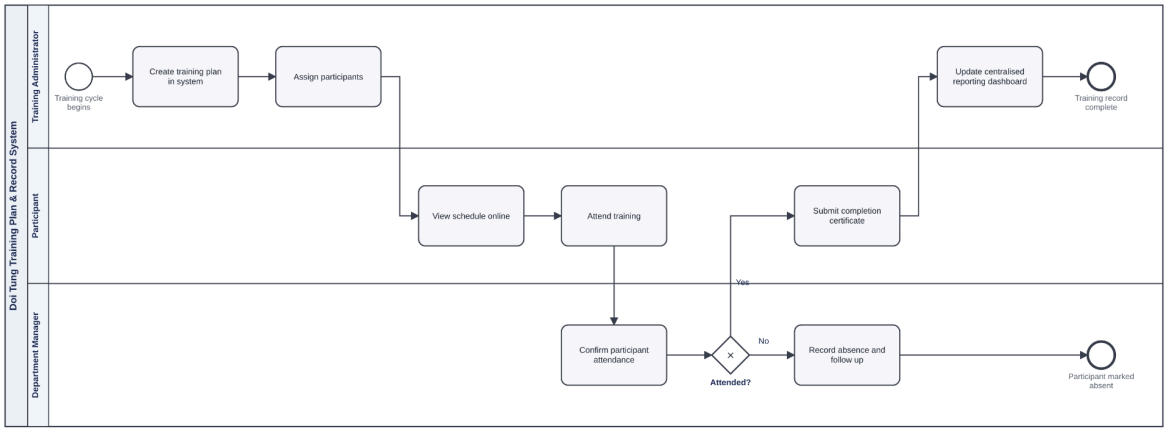

US-06: Check & manage participant's attendance status
As a department manager, I want to check their attendance and mark as "attended or absent".

5. Process Flow

AS-IS Process (Current Process)

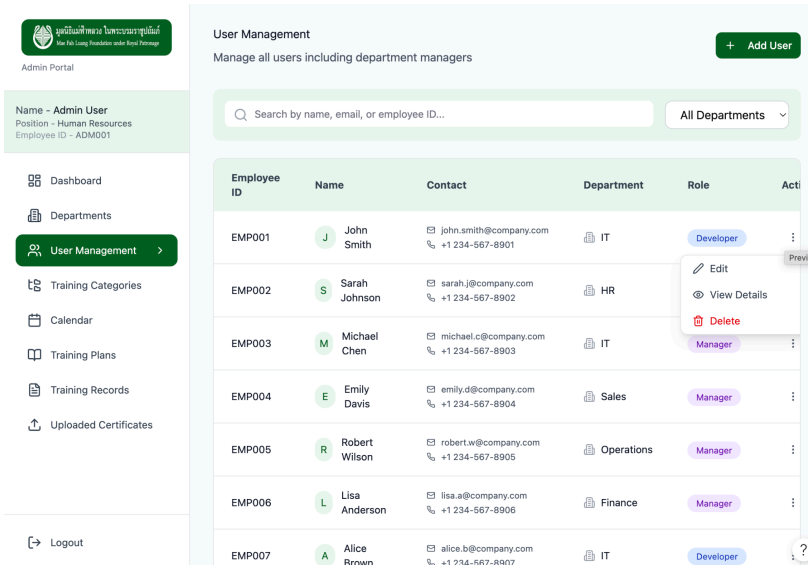

TO-BE Process (Solution)

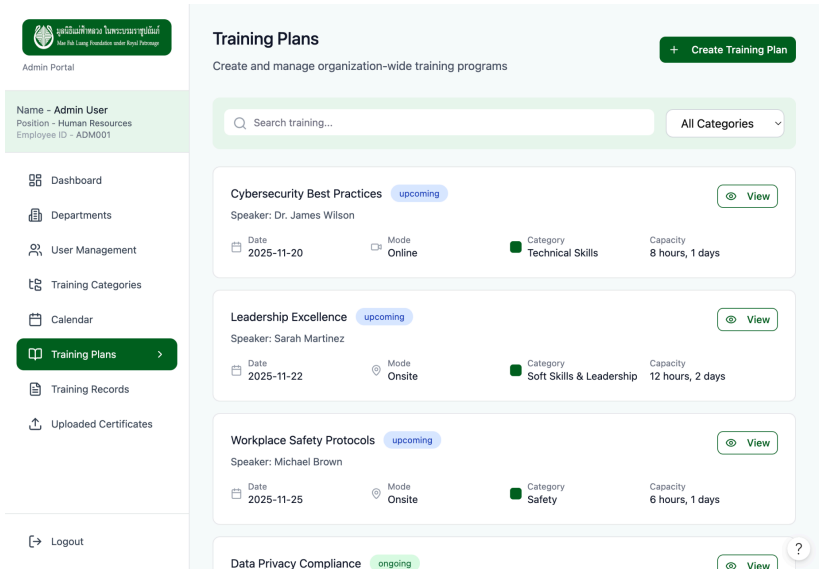

6. Wireframes/Mockups

User Management Page

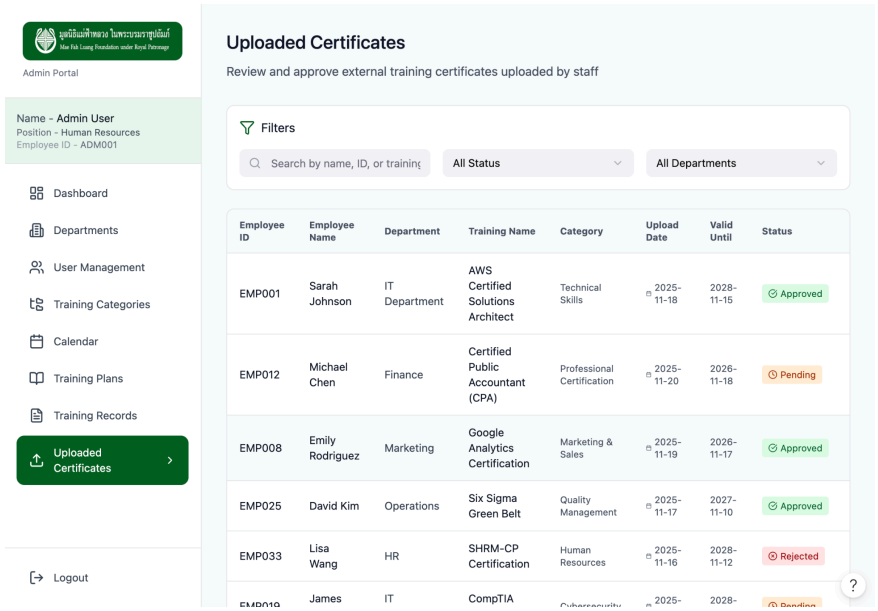

Allows administrators to manage employee profiles and training participation records.

Create Training Plan Page

Enables administrators to create and schedule training activities.

Manage Uploaded Certificates Page

Supports uploading and tracking training completion certificates.

7. Risks & Recommendations

Risk	Recommendation
Data inconsistency due to manual input	Implement validation rules for scheduling conflicts
Scheduling conflicts between training sessions	Use centralized database for consistency
Low system adoption by users	Provide user training for system adoption
System downtime affecting training schedules	Ensure regular system backups and monitoring

Expected Benefits

- Reduced manual administrative effort
- Improved training schedule visibility
- Centralized participant and certificate management
- Better coordination between managers and employees
- Improved accuracy of training records

8. Outcome & Lessons Learned

The Training Plan Management System project provided valuable insights into how technology can improve operational efficiency and support organizational learning processes.

One important lesson was the challenge of managing information across multiple stakeholders. Trainers, administrators, and participants each required different information and functionalities, making it essential to clearly define user roles and responsibilities within the system.

The project also demonstrated the importance of data organization and visibility. Centralizing training plans, schedules, and participant information highlighted how a single source of truth can reduce confusion, improve coordination, and support better decision-making.

Another key takeaway was the need to balance flexibility and control. While administrators require the ability to manage training activities efficiently, the system must also remain simple and intuitive for trainers and participants to encourage adoption.

Finally, the project emphasized how digital transformation can replace time-consuming manual processes with streamlined workflows, allowing organizations to focus more on training effectiveness rather than administrative tasks.
